

SYST 101: Intro to Systems

Lecture 13

Mar. 4, 2003

C. Wells, SEOR Dept.

Announcements

- Next Class: Midterm exam, in class.
Open book, open notes
- Next Week:
 - Midterm break

Agenda

- What is a System, & Key Terminology
- Functions, Functional Decomposition
- Issues Analysis
- Interfaces

Overview/Summary

- All systems exist within other systems.
 - And systems have systems within them.
 - Endless nesting of systems within systems, from the universe down to subatomic particles.
- Systems interact with each other.
 - Both with systems “external” to themselves,
 - And with their “internal” subsystems.

Systems Analysis

- Systems Analysis: The understanding of the structure of a system, and its behavior
 - Structure: what composes a system, what are its subsystems, and what are its interfaces.
 - Behavior: how a system reacts to stimuli from its interfaces (external and internal)

Systems Engineering

- The development or modification of systems to have a desired behavior.
 - Reliably.
 - Without undesired side effects.
 - And in a cost-effective manner.

Systems Analysis

- Analysis of the need
 - Stakeholder requirements
 - House of Quality
- Analysis of the environment & context
 - Issues Analysis
 - External systems and interfaces

Systems Engineering

- Development and design of the new system or system modifications
- Clear, unambiguous representation
 - Functional Decomposition
- Defined, controlled process for bringing the system into being.

What is a System?

- Numerous definitions everywhere
- A System is:
 - A set of interacting components that together accomplish some goal or behavior; it exists within an environment, and can interact with that environment.

Key Terms

- Scope of the System
- Mission or Goals
- Requirements
- Stakeholders
- Lifecycle
- Interactions
- Behavior

Scope of the System

- What is included in your system, and what is not.
- The System's *Boundaries*

Mission or Goals

- What is the system supposed to do?
- How well does it need to do it?
 - Performance
- Criteria for success

Requirements

- Based on the Mission/Goals
- More detail
- Must be clear
- Must be *testable*
 - Someone else should be able to test whether your system satisfies the requirement or not

Stakeholders

- All of the people or organizations that care about or are impacted by the system.
- Everyone who needs to have input into how the system will function or how it will be used.

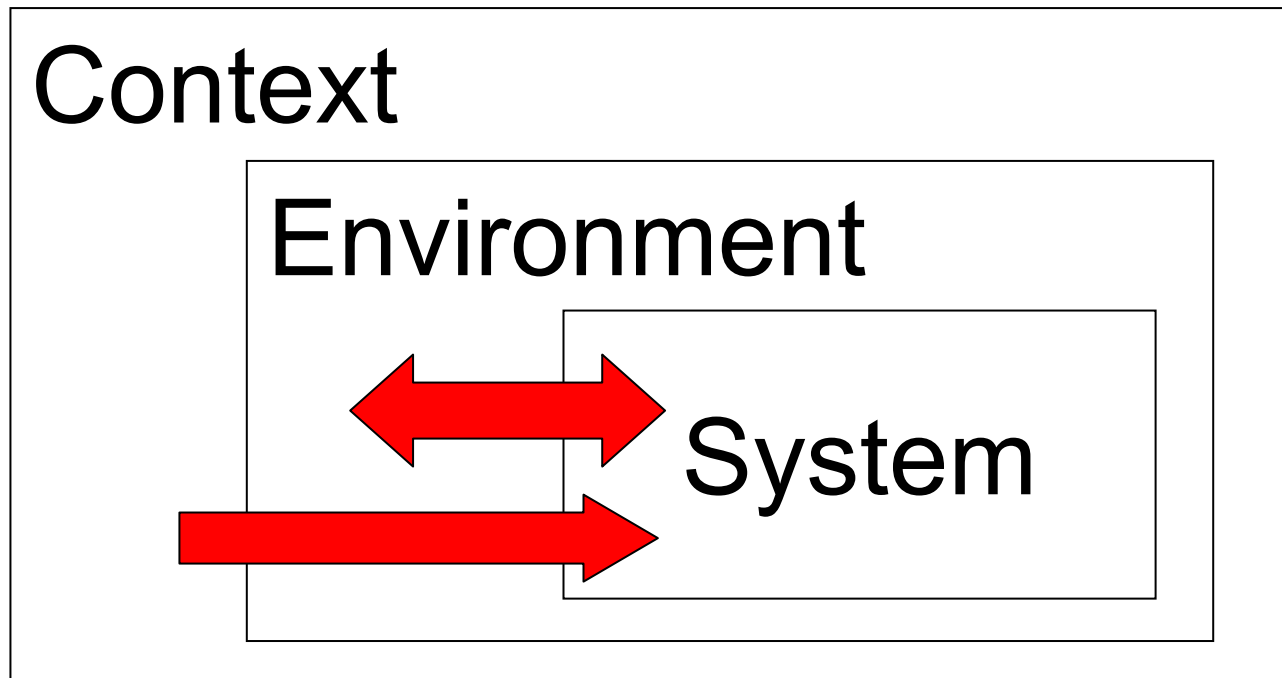

Lifecycle

- Systems usually undergo a “life”
 - Starting with initial ideas and concepts
 - Through the design process,
 - Then they’re developed and tested,
 - Deployed in the field or commercial arena,
 - Maintained and operated,
 - Retired and removed from use.
- Examples where Lifecycle problems exist?

Interactions

- Every system interacts with it's environment.
- And the Context affects the System too.

Environment vs Context

- There are things outside of the system that
 - Can affect the system AND
 - Can be affected by the system.
 - This defines the Environment of the system.
- There are things outside the system which
 - Can affect the system BUT
 - Cannot be affected by the system.
 - This defines the Context of the system

Behavior

- Defines what a system needs to do or does in response to stimuli
- *Stimuli* (plural, stimulus): Various events, conditions or occurrences that stimulate a reaction in the system.
- Systems are usually purchased for their behavior, not their appearance.

So, Systems Engineering Is:

- Learning the mental processes, tools, and ways of thinking that help you figure out all these aspects.
- Learning to apply these tools in order to develop the best system you can with the resources you have.

Functions, Feedback, House of Quality

- Functions (Process) & Feedback
- Functional Decomposition
- Issues Analysis
- House of Quality

How Do Things Get Improved?

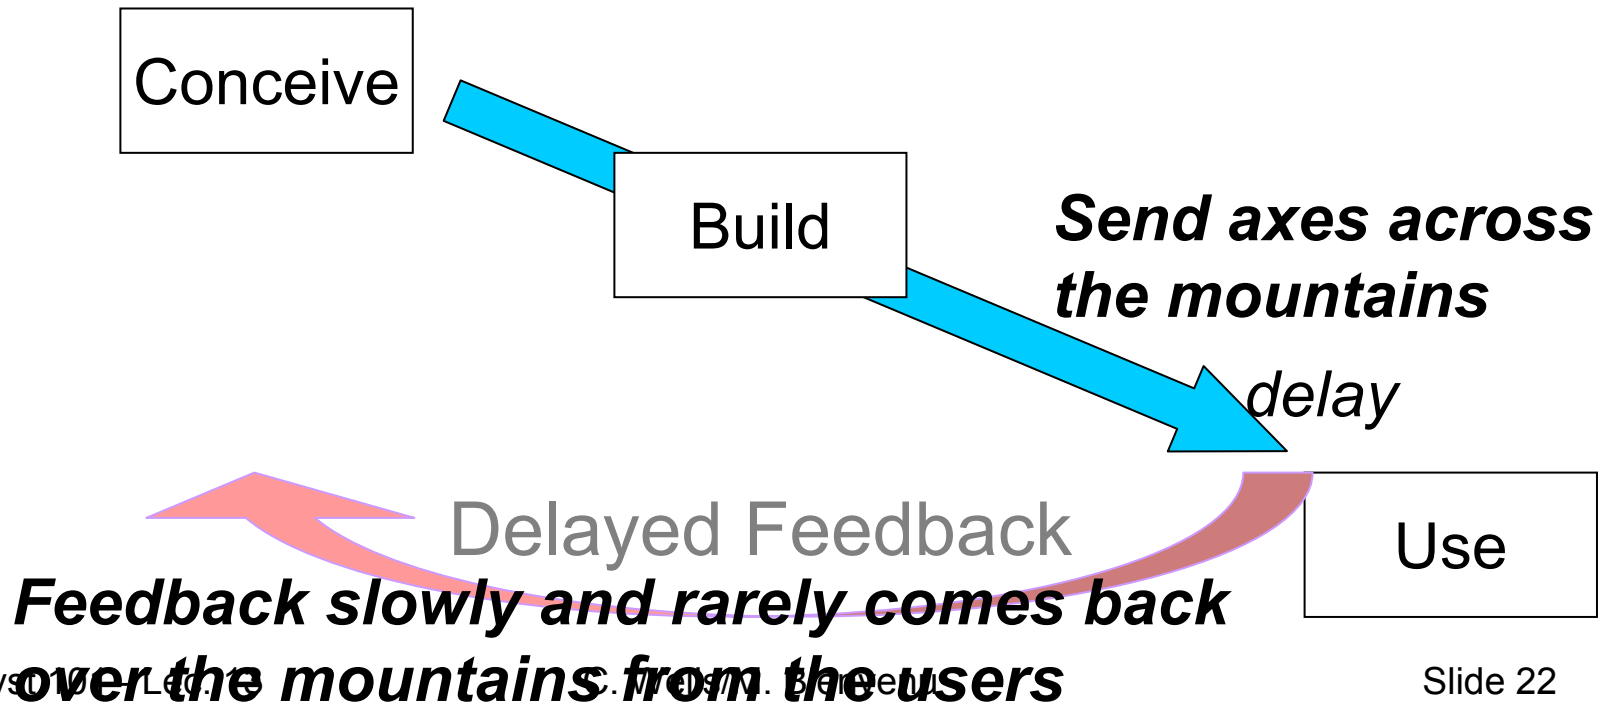

- By Feedback, where the use of the first version provides input to the second version.

Altering the Feedback Loop

- What happens when the feedback is inefficient or significantly delayed?

Processes, Activities, Functions

- All are essentially mean the same thing.
- A function *does* something.
- A function has *inputs* and *outputs*.
- Often graphically represented as a box or ellipse.

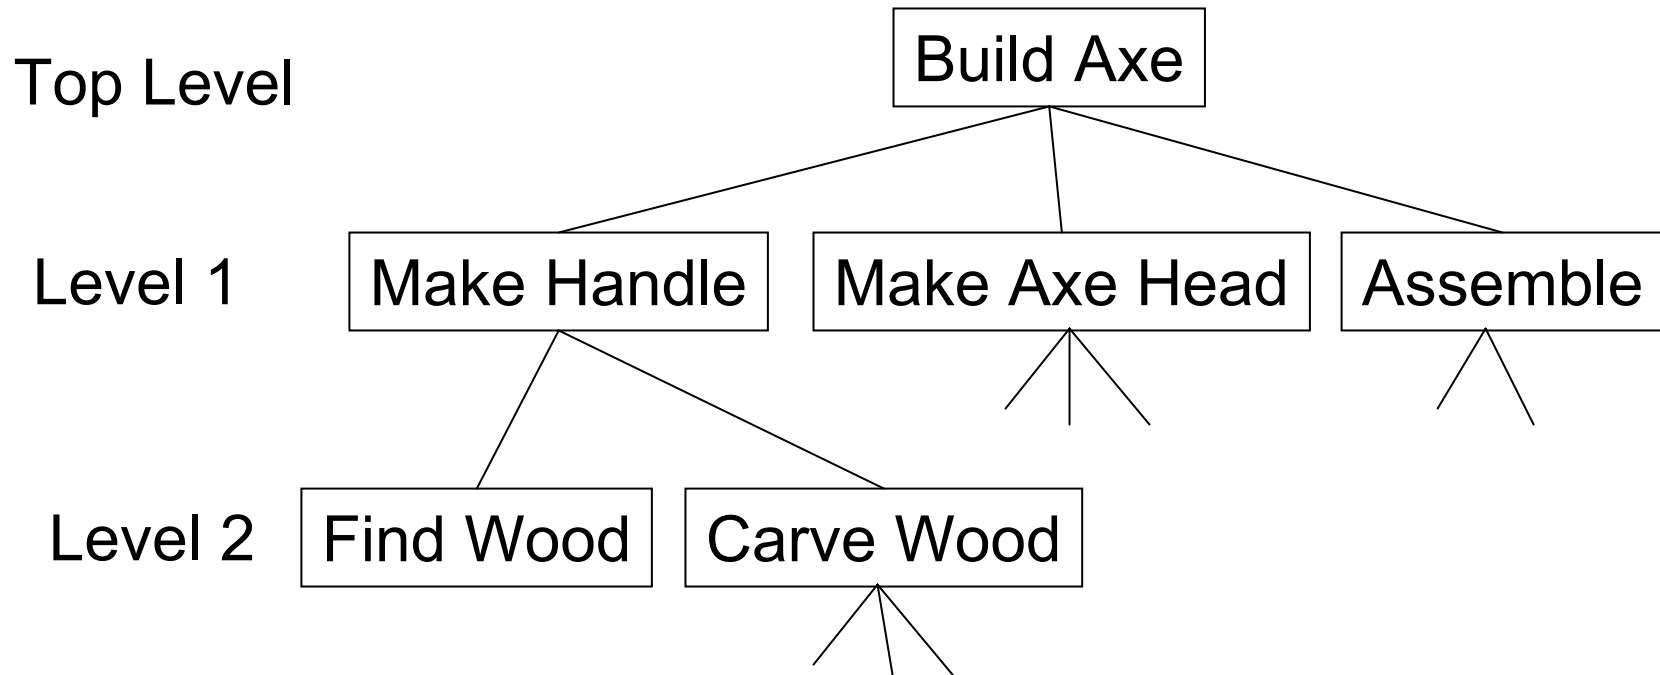

Functional Decomposition

- Any activity can usually be broken down, or decomposed, into smaller activities.
- And those are broken down into more detailed activities, and so on...
- And the result is a hierarchical “decomposition” tree of functions

Details of “Build Axe”

- The hierarchy branches out as it gets more detailed, resembling an upside-down tree.

Process Description

- Just knowing the functions is not sufficient
 - What's the order? What makes me decide to this OR that? When can I start doing a function?
- Dynamic descriptions are also important.

Diagram Syntax

Functional Decomposition – Representation Techniques

Graphical Representation

Outline Form

- F0
 - F1
 - F1.1
 - F1.2
 - F1.2.1
 - F1.2.2
 - F1.2.3
 - F1.3
 - F2

Utility

- “Cost-Benefit”
 - A standard term used often
 - All systems have an associated “cost”
 - Cost to buy, time to learn and use, maintenance costs
 - All (good) systems have a benefit when used.
 - Is what you get out of them worth what you put in?

Issues Analysis

- What's important to achieving these goals?
- How does each issue (wheelbase, wheel size...) relate to the goals and subgoals?
- The goals and subgoals are often called the Customer or Stakeholder Requirements.
- The issues that help you achieve these goals are technical requirements.
- The relations from one category to the next must be kept clear throughout the lifecycle.

Issues Analysis

- Requires logical and careful thinking about the desired end result, and how you plan to get there.
- May require re-thinking your concepts and plans as you proceed.
- May require mathematical analysis or computer simulation.
 - Calculus, Analytical geometry,

HOQ Step 1

- Step 1: List the customer requirements down the side

Key to roof / correlation matrix symbols
 + Positive / Supporting
 - Negative / Tradeoff

DIRECTION OF IMPROVEMENT		TECHNICAL REQUIREMENTS		CUSTOMER IMPORTANCE		Performance measures		Size of range		Technical details	
						Meets European standards	Harness weight	Webbing strength	No. of colors	No. of sizes	Padding thickness
Facilitates climbing	Usability	Easy to put on	2						■	●	
		Comfortable when hanging	5					■	●	■	
		Fits over different clothes	1					■	■	●	
		Accessible gear loops	3								●
	Performance	Does not restrict movement	5	■			■	●	■		
		Lightweight	3		●	■			■	▲	▲
		Safe	5	●	■	●					
		Attractive	2		▲		●		▲	▲	

© Dr. A. J. Lowe 2000

HOQ Step 2

- List the Technical attributes (characteristics) across the top

Key to roof / correlation matrix symbols
 + Positive / Supporting
 - Negative / Tradeoff

DIRECTION OF IMPROVEMENT				↓		↑		↑		↑		↑	
		TECHNICAL REQUIREMENTS		Performance measures		Size of range		Technical details					
CUSTOMER REQUIREMENTS		CUSTOMER IMPORTANCE	CORRELATION MATRIX										
			Meets European standards	Harness weight	Webbing strength	No. of colors	No. of sizes	Padding thickness	No. of buckles	No. of gear loops			
Facilitates climbing	Usability	Easy to put on	2						□		●		
		Comfortable when hanging	5					□	●	□			
		Fits over different clothes	1					□	□	●			
		Accessible gear loops	3									●	
	Performance	Does not restrict movement	5		□			□	●	□			
		Lightweight	3		●	□			□	▲	▲		
		Safe	5	●	□	●							
		Attractive	2		▲		●		▲	▲

HOQ Step 3

- How does each technical attribute support each customer requirement? Strongly? Weakly?

Key to roof / correlation matrix symbols
 + Positive / Supporting
 - Negative / Tradeoff

DIRECTION OF IMPROVEMENT										
TECHNICAL REQUIREMENTS		CUSTOMER IMPORTANCE	Performance measures		Size of range		Technical details			
			Meets European standards	Harness weight	Webbing strength	No. of colors	No. of sizes	Padding thickness	No. of buckles	No. of gear loops
Facilitates climbing	Usability	Easy to put on	2					■	●	
		Comfortable when hanging	5				■	●	■	
		Fits over different clothes	1				■	■	●	
		Accessible gear loops	3							●
	Performance	Does not restrict movement	5		■			■	●	■
		Lightweight	3		●	■			■	▲
		Safe	5	●	■	●				
		Attractive	2		▲		●		▲	▲

Key to interrelationship matrix symbols

- Strong interrelationship
- Medium interrelationship
- ▲ Weak interrelationship

Assumptions in Analysis

- Always starts with simplifying assumptions.
 - Solve the easy problem first, then add complicating factors and issues
- Always keep in mind your assumptions
 - You not really solving the real problem, you're solving something similar (you hope)

Issue Formulation

- How to determine what's important and what's not?
 - How do you know when you've captured all the issues?

Defining Desired Behavior

- One starting point: Function flow diagrams
 - Flowcharts
 - Decision processes
- Structured analysis and object-oriented techniques addressed in SYST 301 & 520.

Systems, Interfaces, Functions & Events

- If two systems can affect each other, then there must be some kind of interface between them
- Specifying an interface is a way of specifying how two systems are allowed to interact.

System Interfaces

- Systems connect to each other through interfaces
- In man-made systems, the interfaces are pretty easy to see...

Interfaces on Common Systems

- The components of a PC have interfaces to each other

- and some of them have interfaces to you.

Interfaces to a familiar system

- Some of the interfaces to the system
Human Being

visual input

audio input

food input, speech output

tactile input.
manipulation output

Events

- Events are things that happen in or to your system
- Events usually have relatively short time durations.
 - Functions, on the other hand, can take a long time to perform

Example Events & Systems

- System: Road Traffic System
 - Events: Accident, Repair Activity starts
- System: PC
 - Event: Type on keyboard, move & click mouse
- System: Human Being
 - Event: Burns hand on stove, sees pretty picture, gets hungry

Internal vs External Events

- Systems are made up of sub-systems.
 - And often a system can be viewed as a sub-system to some larger system

Systems inside systems
inside systems ...

Internal vs External Events

- A system can experience events that come from external systems, or can experience events that come from one of its internal systems
 - When you get hungry, your brain sub-system is responding to low-sugar signals from your endocrine system.

Events vs Functions

- A common modeling technique:
- Envision systems as responding to events by performing a function.
- Events “trigger” functions
- Biology: Stimulus-response

Events & Interfaces

- Systems relate to each other through their interfaces
 - Events are often “transmitted” through some sort of interface.
 - Interfaces are much easier to see in man-made systems
 - Sometimes not so easy to see in natural systems.
 - That’s what makes medicine so hard...

Events, Interfaces & Functions

- Basic modeling concept:

Stimulus-Response

- Basic general form: “When event {a} comes in over interface {i}, then do function xyz.”
 - Optional: “and send event {b} out over interface {k}.”
